

Lost Revenue Alerts

Automated Churn Detection & Rep Alerting System

UK building materials distributor | April 2026

Power Automate

Sharepoint

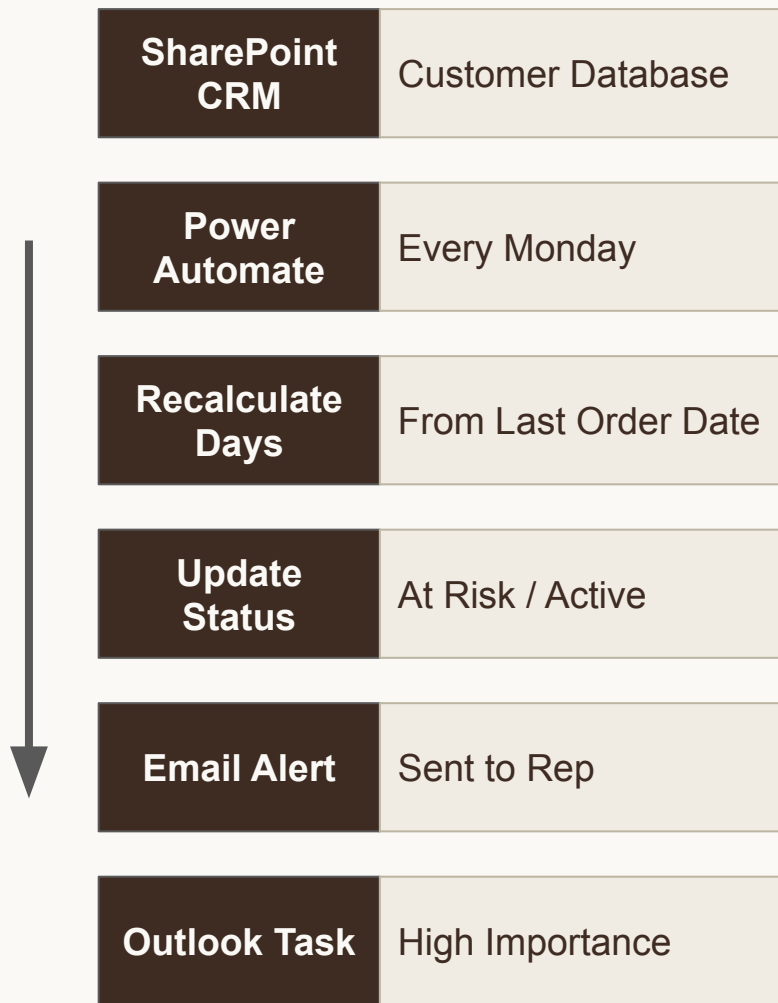

Microsoft 365

Outlook Tasks

Problem	Solution	Impact
In a busy internal sales environment, customer accounts were going quiet without anyone noticing. A customer could stop ordering for 5 to 8 weeks, and unless a Rep happened to remember them, nothing would trigger a follow up. There were no alerts, no thresholds, and no process. By the time the silence was noticed, the relationship was often already lost to a competitor. The revenue impact was invisible until it was too late.	I built a scheduled automation in Microsoft Power Automate that runs every Monday morning without any manual input. It connects to a SharePoint list as a stand-in CRM, recalculates how many days each account has been inactive based on their last order date, and automatically updates their risk status. Any customer inactive for more than 30 days triggers an email alert to their sales rep and creates a follow up task in Outlook, so the rep starts every week with a clear, prioritised action list already waiting for them.	Every Monday, at-risk accounts are identified and surfaced to the responsible Rep automatically. The CRM status across all accounts is refreshed with no manual data entry required. Reps no longer need to remember who to chase, the system does the thinking for them. Revenue recovery activity begins at the start of every working week, consistently, regardless of how busy the team is.

Before This Automation	After This Automation
- No alerts, no process, no visibility of inactive accounts. - At risk customers only noticed after revenue was already lost. - Follow up relied entirely on rep memory and initiative.	- Every Monday, 10 at risk accounts flagged automatically, £147,000 in spend protected. - Reps are notified before the relationship is lost, giving them a real chance to win the customer back. - Rep starts each week with a ready made recovery list in Outlook, no manual work .

The Flow At a Glance

30 Days

Inactivity threshold before alert triggers

10 Accounts

Flagged and actioned every Monday

0 Hours

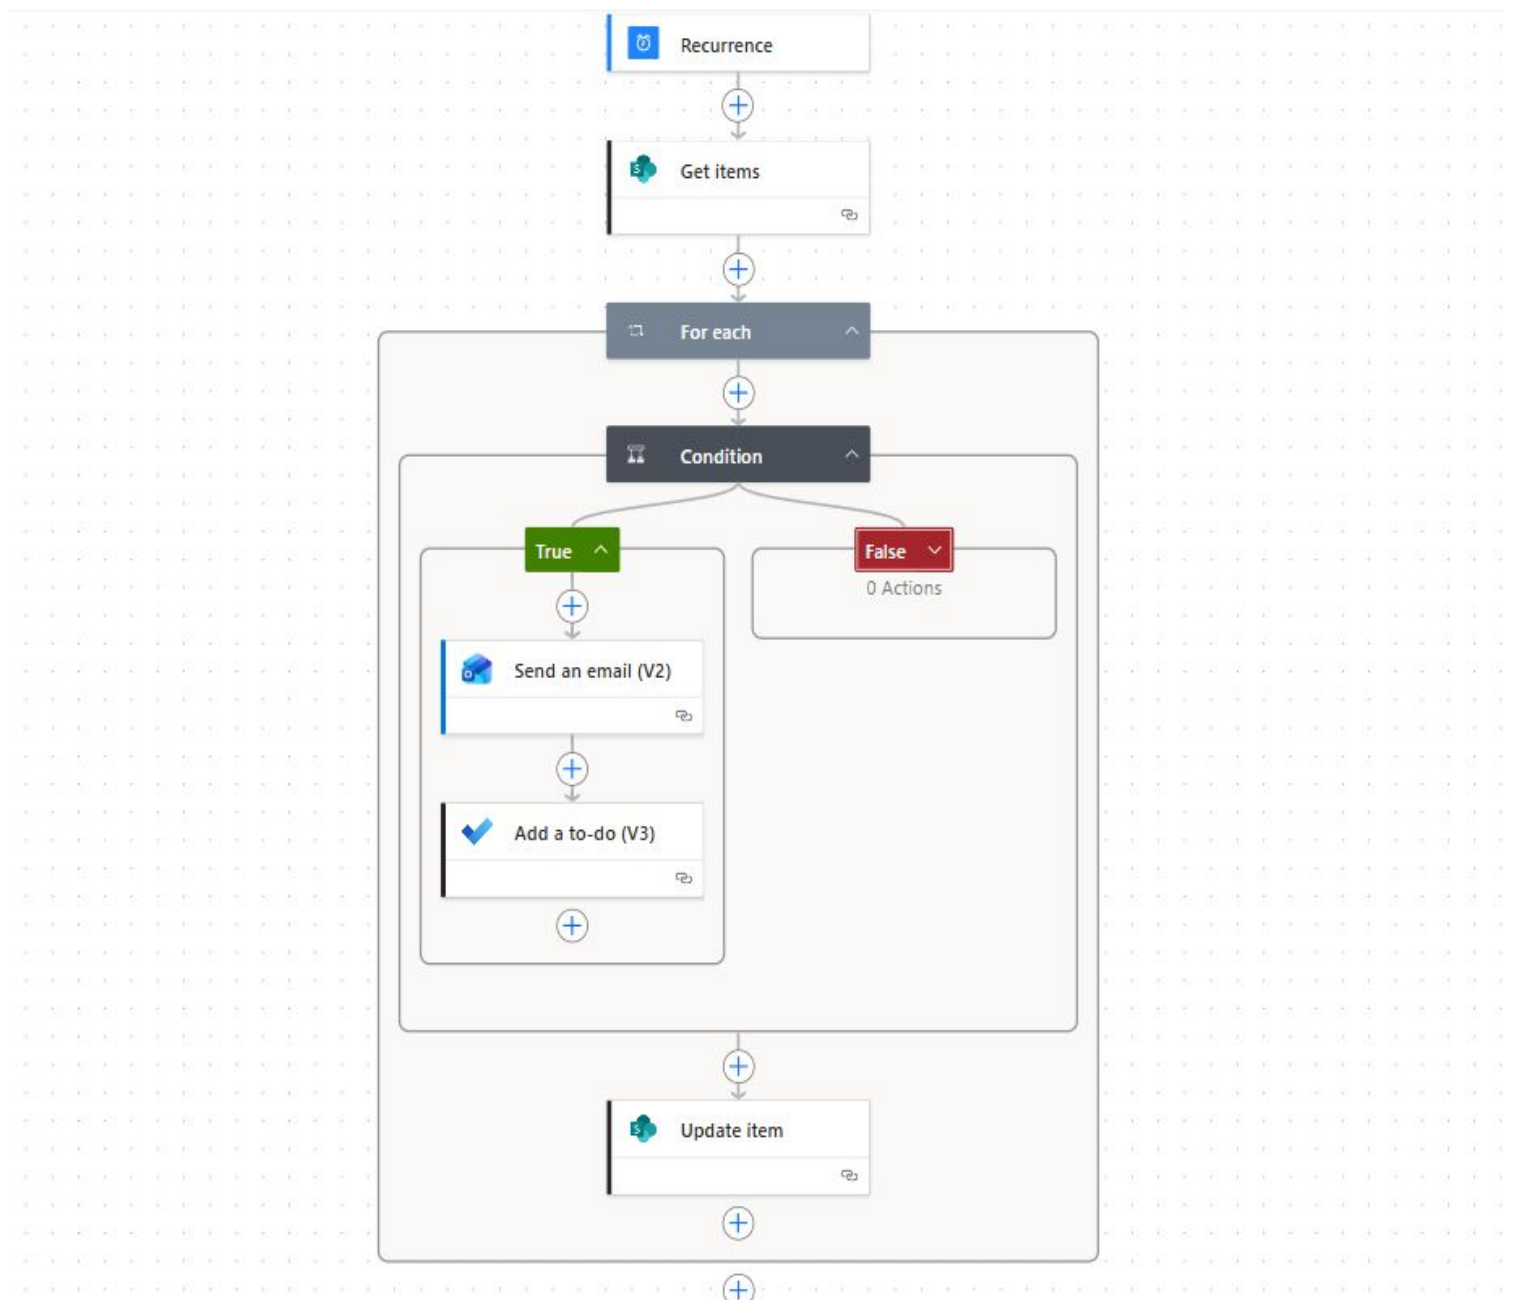

Manual effort required per week

Built & Tested Independently

This project was built using Microsoft 365, replicating a real sales workflow I recognised was needed after seeing at-risk accounts go unnoticed and uncontacted until it was too late to recover them.

All data used in this project is entirely synthetic and GDPR compliant, no real customer or business data was used at any point.

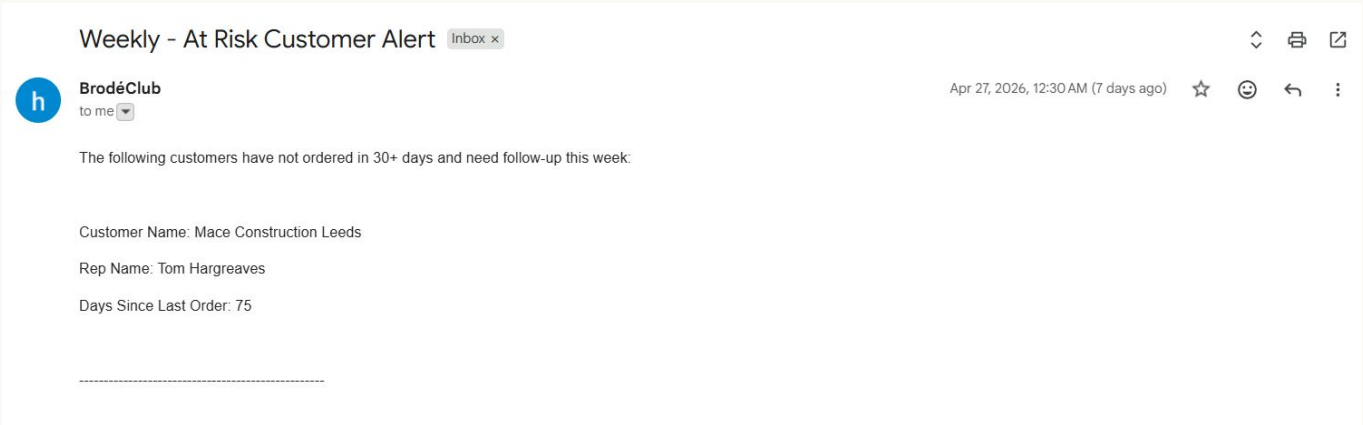

The Automation

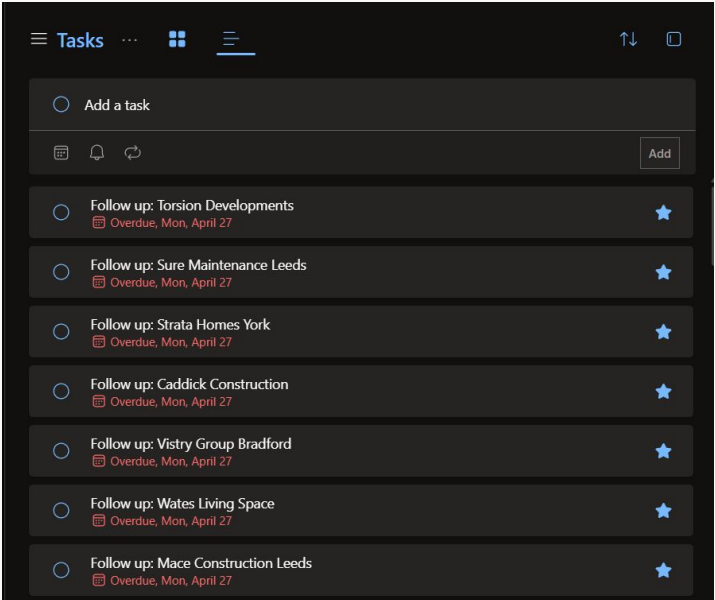

Scheduled flow running every Monday from SharePoint data pull to email alert and task creation

SharePoint list acting as CRM - 20 synthetic customer accounts with risk status and days inactive updated automatically by the flow every Monday.

Weekly alert email delivered to the Rep, Customer Name, Rep, and Days Inactive included.

Follow-up tasks created automatically in Outlook for every at-risk customer, generated by the flow on Monday 27th April with no manual input.
